

Guidance for the Use of Rodent Glue Boards

Although glue boards are not designed to physically harm rodents, their use raises valid concerns and they should only be used in an effective and humane manner. The following principles must be followed in order to minimise animal welfare concerns:

1. Option of last resort

All other options for rodent control must be considered before glue boards are used. Detailed records must show why other control methods are either considered inappropriate or have failed.

Where there is a rodent in a high risk environment, it may be appropriate for glue boards to be placed strategically to ensure immediate control.

2. Check boards frequently

Where rodent boards are used these must be inspected at appropriate intervals. This should be within 12 hours of placing, or at least as soon as is reasonably practicable, including weekends and bank holidays.

If unavoidable events cause slight extensions to inspection intervals, then the reasons should be recorded. Longer delays must be avoided (see contingency plan below). Where possible and practical, inspection times must be organised to minimise the time rodents are likely to be on the board (e.g. if rodents are known to be active during certain periods, inspection times should be arranged with this in mind). If a caught animal displays signs of undue suffering or serious physical harm, the intervals between inspection times must be shortened.

3. Contingency plan

A contingency plan must be in place so that in the event of an emergency a second competent person can be called upon to inspect the boards and deal with any captures or safely remove the boards as appropriate.

Where it is known boards will not be inspected at appropriate intervals they must be taken up (even if only temporarily).

4. Protect non-target species

Boards must be placed in such a manner that they do not present a risk to non-target species.

5. Use the correct size board for the pest species

The size of board must be appropriate for the target species.

6. Detailed records

Detailed copies of records and location plans should be available on site at all times for all boards laid during any treatment and must be updated as necessary to ensure traceability. This will allow for all board to be accounted for during inspection and prevent boards being forgotten about.

7. Dispatch of trapped rodents humanely

Rodents trapped on rodent boards must be dispatched quickly and humanely by someone with appropriate training. Placing the glue board in a clear plastic bag and dealing the rodent a sharp blow to the head with a blunt instrument would be an appropriate mode of dispatch. Drowning is not an acceptable method of dispatch.

8. Non-target animals

In the event that a non-target animal is trapped, a suitable food grade oil or similar emollient should be applied to the animal for removal. Non-targets should only be released at their site of capture, not elsewhere, and only if they appear to be physically unharmed and their release is not prohibited by law.

9. Remove boards at the end of treatment

At the end of treatment all rodent boards must be accounted for upon removal.

10. Dispose of boards safely

Rodent boards should be disposed of with care. The sticky surface should be covered to avoid the accidental trapping of non-target species or subsequent misuse, and the board should be disposed of in accordance with local authority waste requirements.

Please refer to the Animal Welfare Act 2006 with regards to Duty of Person Responsible for Animal to Ensure Welfare and the Prevention of Unnecessary Suffering.
